

Clearwater's OCR–Quality[®] Risk Analysis Approach

The one-size-fits-all approach to assessing cyber risk leaves a lot of questions unanswered.

Healthcare leaders are struggling to demonstrate risk reduction and program maturity despite completing assessment after assessment. This is because assessments only offer real value if they deliver actionable insights. If you stop assessing risk at the control level, you'll miss the risks and vulnerabilities hiding among your organization's component groups. Asset-based risk analysis doesn't just check your compliance box; it equips you with insight and measurable risk data you can act on.

Precision & Confidence

Better visibility to your PHI and how it's used and connected across your control groups means no more overlooked risks.

Successful Board Engagement

A narrative that helps you demonstrate progress makes it easier to engage your board and earn their support.

Cost Savings & Spending Power

Demonstrating risk reduction over time helps justify the investment decisions you've made and advocate for new ones.

Compliance Assurance

When you do risk analysis by the book, you'll protect your organization and meet HIPAA requirements at the same time.

Actionable Information

Meaningful data and analytics help you make better decision and communicate more effectively.

Risk Reduction

Don't restart the same process year after year, leverage better cycle management and systematically reduce risk over time.

Program leader	☐	☒
Ongoing advisory services	☐	☒

“

The true risk assessment has made the biggest impact. Other companies give risk assessments, but Clearwater came in and did a very clearly laid-out job. They met well with the business and IT people, and we have the best picture of our risk that we have had since I have been with the company. I presented the assessment to the board, but Clearwater gave me the materials that made the assessment understandable to the board.
